Checkbox Tests:

First Checkbox Here:
> It should have an _is in the variable name
> It should end in an _yes
> This and the second test serve to test my detection and parsing of _yes and _no at the end of variable names and to detect the _is automatically...

Second Checkbox Here:
> The variable name should be the same as the first checkbox
> But with a _no on the checkbox

Third Checkbox Here
> The variable name should have a _is
> But it should not have a _no or a _yes in the name
> This serves to test just the _is logic without the _yes and the _no logic

Radio Button Tests:

First Radio Button here:
> This should be identical in structure to the Checkbox logic above
> Create four radio buttons, with values of 1,0,true, false

Second Radio Button here
> This should be identical in structure to the Checkbox second test above
> Create four radio buttons, with values of 1,0,true, false

Third Radio Button here
> This should be identical in structure to the Checkbox second test above
> Create four radio buttons, with values of 1,0,true, false

Fourth Radio Button test here
> This should be a series of radio buttons with plain text choices instead of "1,0,true,false" something like "choice 1, choice 2, spagetti" etc etc...
